

ABSTRACT

The present invention relates to a pocket flap apparatus that can be alternatively adjusted and moved between an exposed position and a concealed position. The pocket flap apparatus further includes one or more retainers for releasably securing firearm ammunition. The flap can be positioned inside the pocket to conceal the ammunition, or the flap can be positioned outside the pocket to provide convenient access to the ammunition. The concealed position of the flap allows the garment, to which the pocket is attached, to be used for general purposes while concealing the flap, the retainers, and any ammunition secured to the flap.
